The T-Max® G2 wireless adapters allow you to connect an entire salon without running cables through the walls of your salon. The T-Max® G2 also allows you to expand a current T-Max® Series without running additional cables throughout your salon.

The T-Max® G2 Series works by transmitting the T-Max® communications via a 900Mhz RF (radio frequency) signal. This allows each timer in your salon to communicate with the T-Max® Manager or T-Max® Manager/Pro without the need of running cables throughout your salon. The T-Max® G2 Wireless Series works with all Applied Digital, Inc. T-Max® products.

**Important Installations Notes:**

1. Make sure each G2 Access Point is installed upright with the antenna facing up.
2. All G2 Access Points must be at least 2 feet apart even if separated by a wall. Make sure they are not right across from each other on different sides on the same wall in adjacent rooms.
3. If connecting G2 Access Points on multiple floors, do not place a G2 Access Point directly above the G2 Access point connected to the T-Max® Manager. Make sure they are offset by at least 2 feet.
4. Make sure the G2 Access Point is mounted above the highest point on the tanning bed (when the canopy is raised).
5. Make sure the G2 Access Point is not mounted next to metal such as metal studs in walls, vending machines, vents etc.

**Connecting Two T-Max® 3Ws in Master/Slave**

Set the address on the T-Max® 3Ws at the front desk to address 0 and the T-Max® 3Ws in the tanning rooms to address 1 as described in the T-Max® 3W Users Guide. Connect the T-Max® 3W to the tanning bed as described in the T-Max® 3W and tanning bed user’s guides. DO NOT run the provided modular cable from the front desk T-Max® 3W’s to the tanning room as described in the manuals. Connect a T-Max® G2 System to each T-Max® 3Ws as shown here.

Connect the power supply to the power screw terminals on the back of the T-Max® 3W (or connect the provided power supply with the Power Injector to the power input). Connect the RJ11 cable between the G2 Access Point and the RJ-11 jack on the back of the T-Max® 3W.

**Note:** You do not have to connect the Power injector and T-Max® 3W to a common power supply. You can provide power with separate power supplies if desired.

ADI PN:60000000053  (Optional)

---

**Note:** If the tanning bed has an in bed T-Max® timer, simply connect the T-Max® G2 Access Point directly to the RJ-22 port on the tanning bed. You don’t need to add anything if there is an in bed T-Max® Timer and G2 Access Point already in your tanning bed.
Connecting Multiple T-Max® G2 Modules to a T-Max® Manager or T-Max® Manager/Pro

Decide where you want the T-Max® Manager and timers to be installed in the rooms. DO NOT run the modular cables through your walls as described in your manuals.

Connect the G2 Access point to the Power injector using the supplied RJ-11 Cable.

Once the system is installed, auto address the systems described in your T-Max® Manager or T-Max® Manager/Pro manual. Operate the system as normal.

If you are using a T-Max Manager G2, You do not need a power injector. The G2 Access point will connect directly to the T-Max Manager G2.

Expanding an Existing T-Max® Installation with G2 Wireless Adapters.

Using the G2 wireless system, you can expand a current T-Max® Series without running additional wires to your new rooms. Simply connect a G2 system to the end of your current T-Max® daisy chain, then connect a G2 system to the new T-Max® 3W or tanning bed with a T-Max® timer built in. If you are adding a tanning bed with the G2 Access point installed, you don’t need to add anything else.

Address the new timers as described in the T-Max® 3Ws or tanning bed users guides. It may be necessary to set the maximum bed number in the T-Max® Manager or Manager/Pro as described in their respective user’s guides.

Troubleshooting

If, after installing the system, you do not get communications between units:

1) Make sure all units and timers are getting power and properly connected to the tanning units.
2) Make sure the data lights on the G2 Access Points are flashing. If there are lights on but none are flashing rapidly, it may be necessary to move the G2 Access Point unit to another location. Move the G2 access Point unit until the data light starts flashing.
3) Make sure the distance between the G2 Access Points connected to the T-Max® Manager and the furthest wireless module does not exceed 300 feet. You may need to move the G2 access Point.
4) Make sure the G2 Access Points units are at least 2 feet apart from each other.
5) If you are connecting G2 systems units on multiple floor levels, make sure the G2 Access Points units are not directly above the G2 Access Points unit that is connected to the T-Max® Manager.
6) The Frequency of the G2 Access Points units may have to be changed. Contact Applied Digital Technical Support for instructions.
